Assumptions – FLM Helpdesk Communication Platform PoC

1. NexTask Integration and Data Availability

NexTask will send ticket/alarm assignment and relevant lifecycle events from the UAT environment to the AutomationEdge-provided API in an agreed structured format (such as JSON), including the following information:

- Event ID, Event Type, Event Timestamp
- Ticket ID and Assignment ID
- Alarm ID (when applicable)
- Site Number / Name
- Issue Description or Alarm Type
- Severity
- Ticket Status
- Alarm Status (when applicable)
- Technician ID, Name, Mobile Number and Preferred Language
- Team Leader ID, Name, Mobile Number and Preferred Language
- Manager ID, Name, Mobile Number and Preferred Language
- Engineer, Team Leader and SPOC contact details for Emergency notifications
- Dynamic Acknowledgement Digit (DTMF)
- Assignment and Reassignment Details
- Operational Status Updates (Departed, Arrived, Started)
- Ticket Closure Date/Time, Final Status and Resolution Details

Additional Assumptions:

- NexTask will automatically send initial assignment, reassignment, relevant operational status changes, alarm clearance, severity changes and ticket closure events to the AutomationEdge API.
- The required event data will be provided in English or an agreed standard format. Voice communications will support Arabic, English and Urdu.
- NexTask will provide the currently assigned technician along with the corresponding Team Leader and Manager details.
- NexTask will provide the required technician-to-Team Leader-to-Manager mapping for the PoC. A complete list of available technicians is not required for the baseline workflow unless separately agreed.
- Recipient mobile numbers will be provided in a valid international format, including the applicable country code.
- NexTask will remain responsible for technician assignment and reassignment. AutomationEdge will not select or reassign technicians.

2. Data Storage and Workflow Execution

- Ticket/alarm details received from NexTask will be stored in the AutomationEdge database for workflow execution, communication tracking and audit purposes.
- Based on the received events and configured business rules, AutomationEdge will initiate automated voice calls to the assigned Technician, Team Leader or Manager and send WhatsApp notifications to the applicable recipients.
- The initial technician notification will allow a maximum of two voice call attempts.
- If the technician rejects the assignment or fails to acknowledge after two attempts, AutomationEdge will initiate the escalation workflow.
- During escalation, WhatsApp notifications will be sent to both the Team Leader and Manager in parallel. The Team Leader will be called first, followed by the Manager if the Team Leader does not answer.
- AutomationEdge will maintain call attempts, DTMF responses, communication acknowledgements, retry timers, escalation stages, WhatsApp delivery outcomes and workflow history.
- Pending communication activities will be cancelled or adjusted based on the latest valid ticket status and assignment updates received from NexTask.

3. Acknowledgement and Status Synchronization

- When a technician acknowledges a voice call using the requested DTMF digit, the communication acknowledgement will be recorded in the AutomationEdge database against the corresponding Ticket ID and Assignment ID.
- Communication acknowledgement in AutomationEdge will not automatically update ticket acceptance or operational status in NexTask.
- Operational statuses such as Departed, Arrived, Started and Closed will be maintained and updated in NexTask.
- NexTask will automatically send relevant operational status updates to AutomationEdge, which will update its local records and determine whether pending communication activities should continue or be cancelled.
- Once a technician successfully acknowledges the call, AutomationEdge will initiate a 15-minute follow-up timer.
- If the ticket is Closed, Reassigned, or its operational status is updated to Departed, Arrived or Started before the reminder is due, the pending reminder will be cancelled.
- If the ticket remains active with no required operational progress after 15 minutes, AutomationEdge will initiate one reminder call, subject to the latest valid ticket and assignment state.
- No communication outcome updates from AutomationEdge to NexTask are required as part of the current PoC scope.

4. Technician Reassignment

- Technician reassignment will be performed and maintained in NexTask.
- Whenever a ticket is reassigned, NexTask will send a reassignment event to AutomationEdge containing the updated Assignment ID, Technician Details and corresponding Team Leader/Manager information.

- Upon receiving the reassignment event, AutomationEdge will cancel pending calls, reminders and escalation activities associated with the previous assignment.
- AutomationEdge will initiate the technician notification workflow for the newly assigned technician.
- Communication history associated with the previous assignment will be retained for audit and tracking purposes.
- AutomationEdge will not perform technician selection or reassignment in NexTask.

5. Emergency Ticket Notifications and Closure

- Emergency ticket creation, severity updates and closure will be managed in NexTask.
- NexTask will send an event to AutomationEdge whenever a ticket is created as Emergency or an existing ticket is changed to Emergency.
- Based on the received event, AutomationEdge will send WhatsApp opening notifications to the Engineer, Team Leader and SPOC in parallel.
- Once an Emergency ticket is closed in NexTask, NexTask will send the corresponding closure event to AutomationEdge.
- AutomationEdge will send WhatsApp closure notifications to the Engineer, Team Leader and SPOC and record the notification outcomes in its database.
- Emergency opening and closure notifications will be tracked separately to avoid duplicate messages.

6. Communication Service Integration

- AutomationEdge will integrate with an agreed voice calling service capable of supporting Arabic, English and Urdu voice prompts, dynamic DTMF acknowledgement and call status tracking.
- The voice calling service will provide the necessary APIs or callbacks to capture call outcomes such as Answered, No Answer, Busy, Failed and DTMF responses.
- An approved WhatsApp Business API integration will be available for technician escalation and Emergency opening/closure notifications.
- The client will provide or approve the required voice scripts, WhatsApp message templates, sender details and authorized test recipient numbers.

7. Tracking and Audit Dashboard

- A separate tracking and audit dashboard will be provided to monitor ticket-wise communication activities.
- The dashboard will display voice call attempts, acknowledgement results, WhatsApp notification statuses, escalation history, reminder activities, cancellations and exceptions.
- Users will be able to search and filter records using Ticket ID, Alarm ID, Assignment ID, Technician, Call ID, WhatsApp Message ID and other relevant parameters.
- The dashboard will support exporting communication and audit records for PoC validation.
- NexTask will remain the source of truth for ticket assignment, operational status and closure, while AutomationEdge will maintain communication execution and audit records.
